A documentary of 52'

Digital Betacam 16/9

This shocking documentary brings together the most important figures of science today, in a harsh eye-opening account of the catastrophic impact that present-day consumer society is having on the future of the world's climate.

A climate which we already know will see a temperature rise of several degrees...but do most of us really know what that means?

It is not simply a question of delighting in the new-found ability to grow palm trees in your Parisian garden, for millions of people, it will mean forced exodus! And, for the major world capitals, complete economic meltdown.

In the last two centuries, man has released massive amounts of carbon into the atmosphere; carbon which nature has been spent millions of years absorbing.

The different projection models of climate change allow us to foresee the potential consequences on the horizon, particularly in terms of vegetal, human, and parasitic migration.

In the face of these projections, what are the objectives we need to attain in terms of sustainable development ?

Is the current economic system capable of integrating these objectives ?

Does this leave us with no alternative but pessimistic resignation ?
